TapTrack User Manual

Smart Attendance Management System

Notre Dame of Marbel University

Version 1.1: September 18, 2026

This manual explains the tasks available to a TapTrack Superadmin. Screen contents may differ as records and the active academic period change.

Security: Use only your assigned account. Do not share passwords, leave a signed-in workstation unattended, or include live credentials in printed copies of this manual.

1. Sign in and navigate

Open the TapTrack URL supplied by MIS using Chrome or Edge on the university network. Enter your username and password, then select Sign in. Contact MIS if the account is inactive or the password is unavailable.

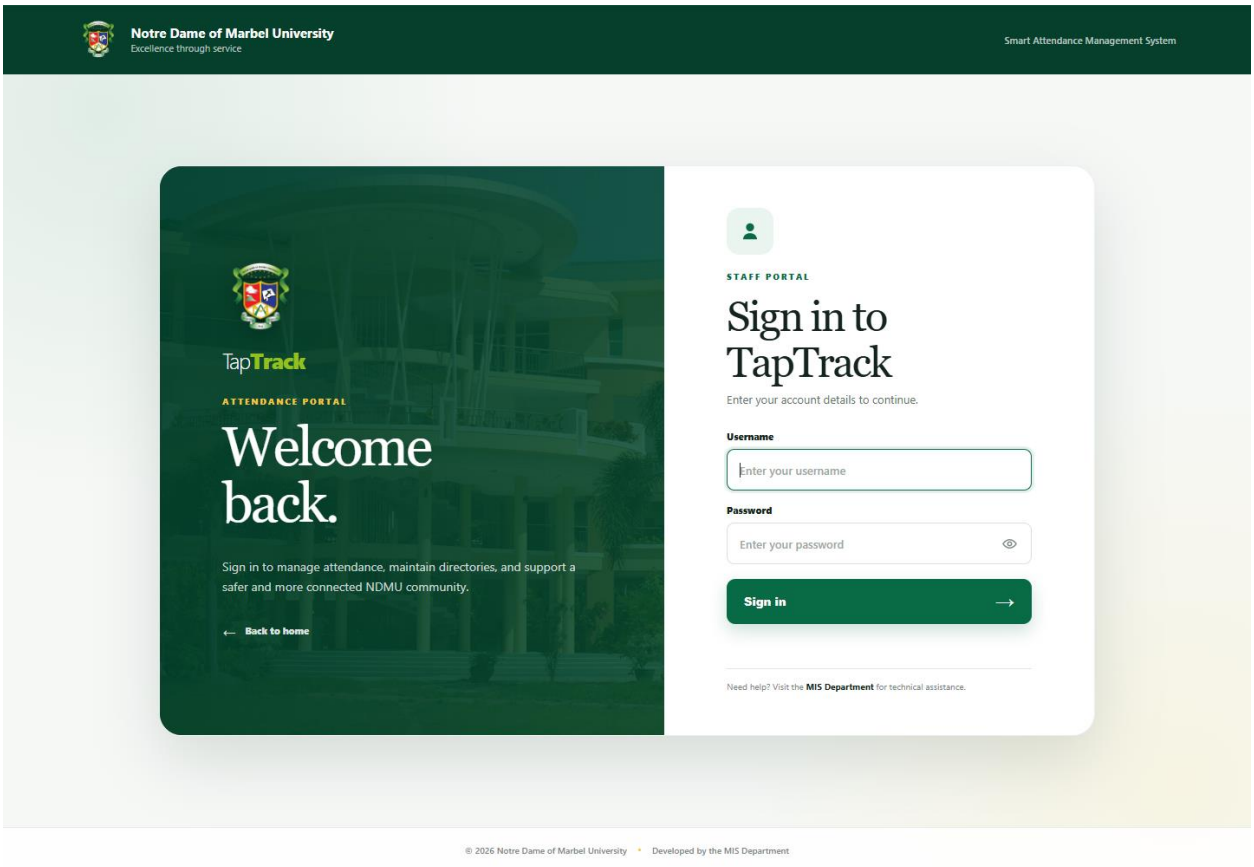

Figure 1. TapTrack sign-in page

After signing in, use the menu button at the upper-left to open the navigation panel. The panel contains:

- Overview and University entrance logs
- Events: Event management and Past events
- Library: Library entrance logs and Internet section logs
- Maintenance: student, alumni, and employee directories; academic records; kiosks; and system settings
- Users & access: activity logs, permissions, and user accounts
- Password and Sign out at the bottom

The current academic period appears at the upper-right. Confirm it before recording attendance or creating events.

The collapsed sidebar keeps the same icon sizes as the expanded sidebar. Hover over an icon to see its module name. Selecting a module that contains submodules, or selecting the user profile at the bottom, automatically expands the sidebar.

2. Overview

The Overview shows how many people are currently inside, the number of registered students and employees, and today's latest university entrance activity. Select View all to open the complete entrance log.

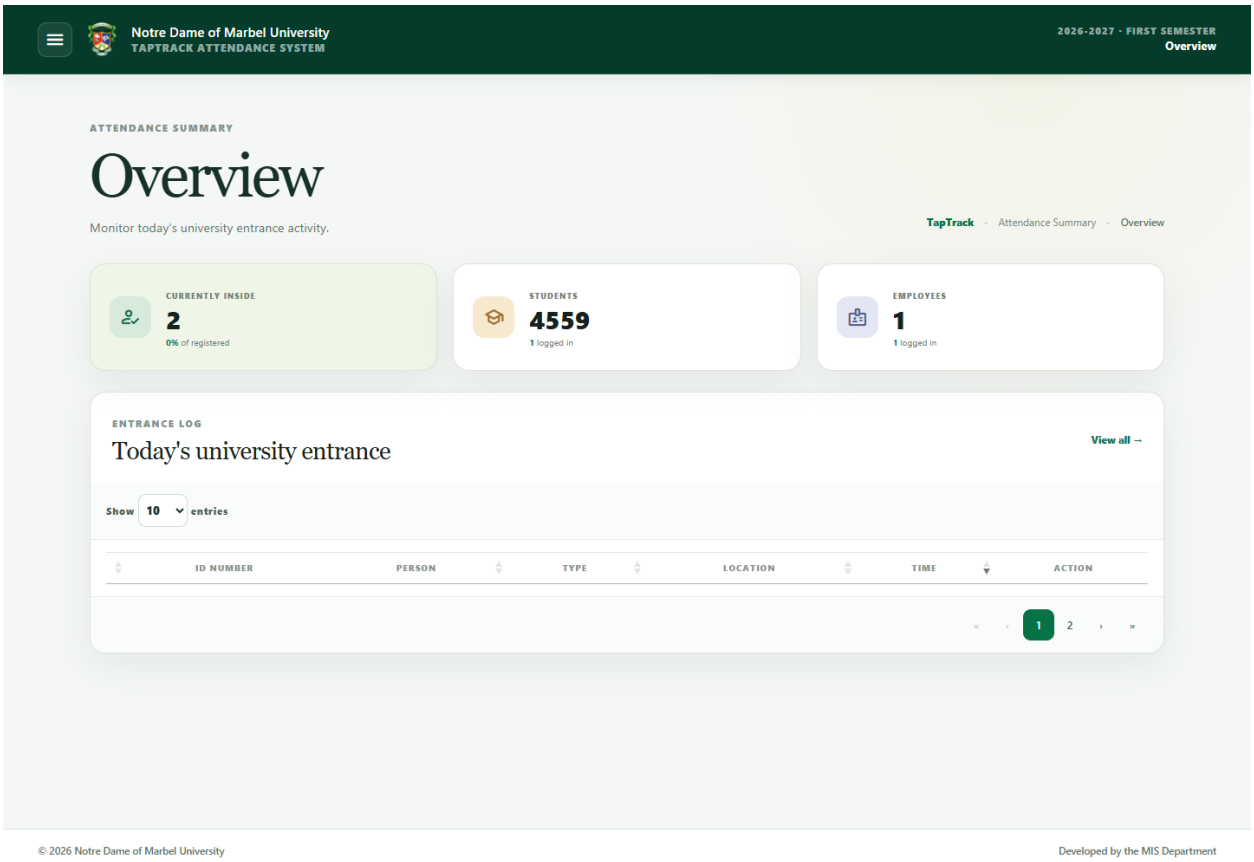

Figure 2. Superadmin overview

3. University entrance logs

Open University entrance logs to review Time In and Time Out records.

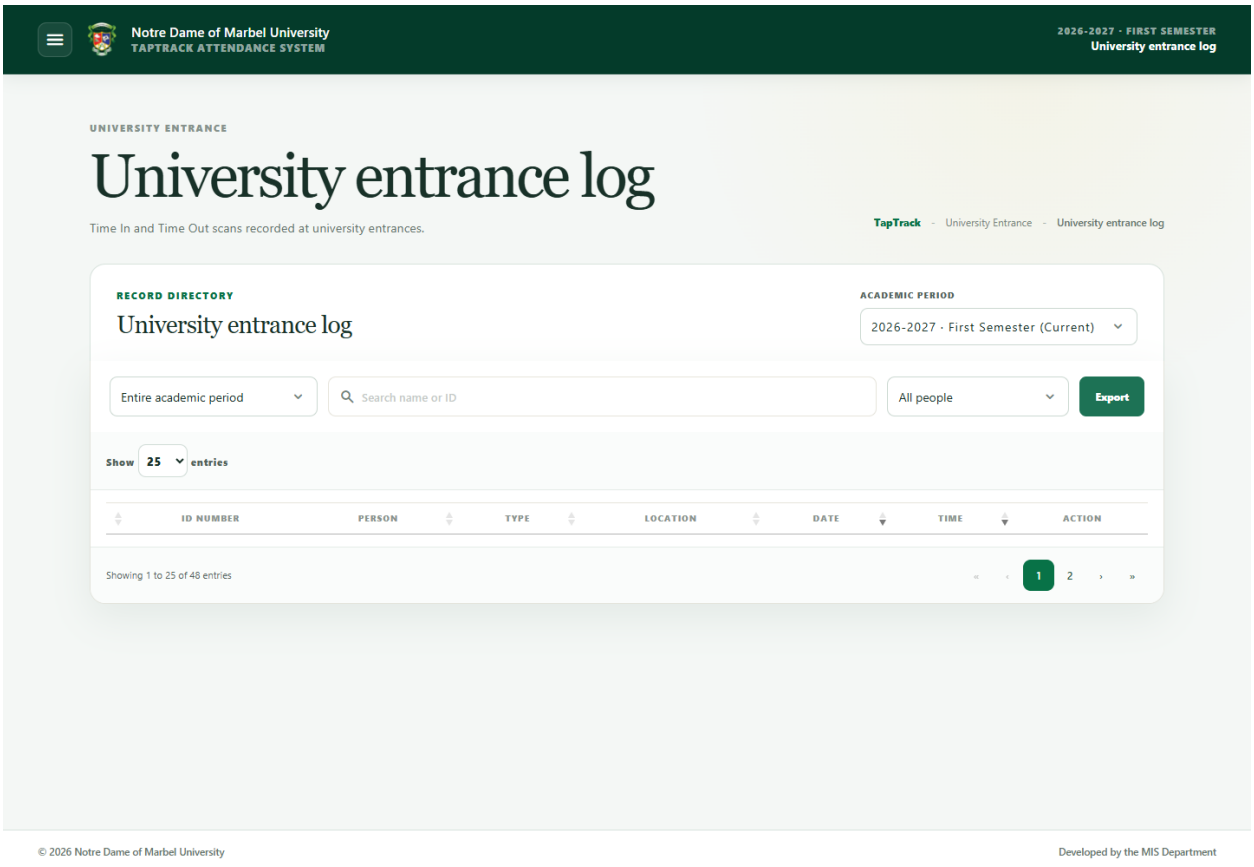

Figure 3. University entrance logs

Use the page to:

1. Select an academic period when reviewing historical data.
2. Search by ID number or name.
3. Filter or sort records using the available table controls.
4. Export records when an export control is available.
5. Select a person's row/action to review or export that person's attendance.

Location identifies the terminal where the ID was scanned. The latest entrance time is displayed in the entrance records. A scanner being assigned or paired is configuration activity and does not itself create an attendance log.

4. Event attendance

4.1 Create and manage an event

Open Events → Event management. Select Add event, complete the event name, schedule, audience, scan limits, and other required fields, then save.

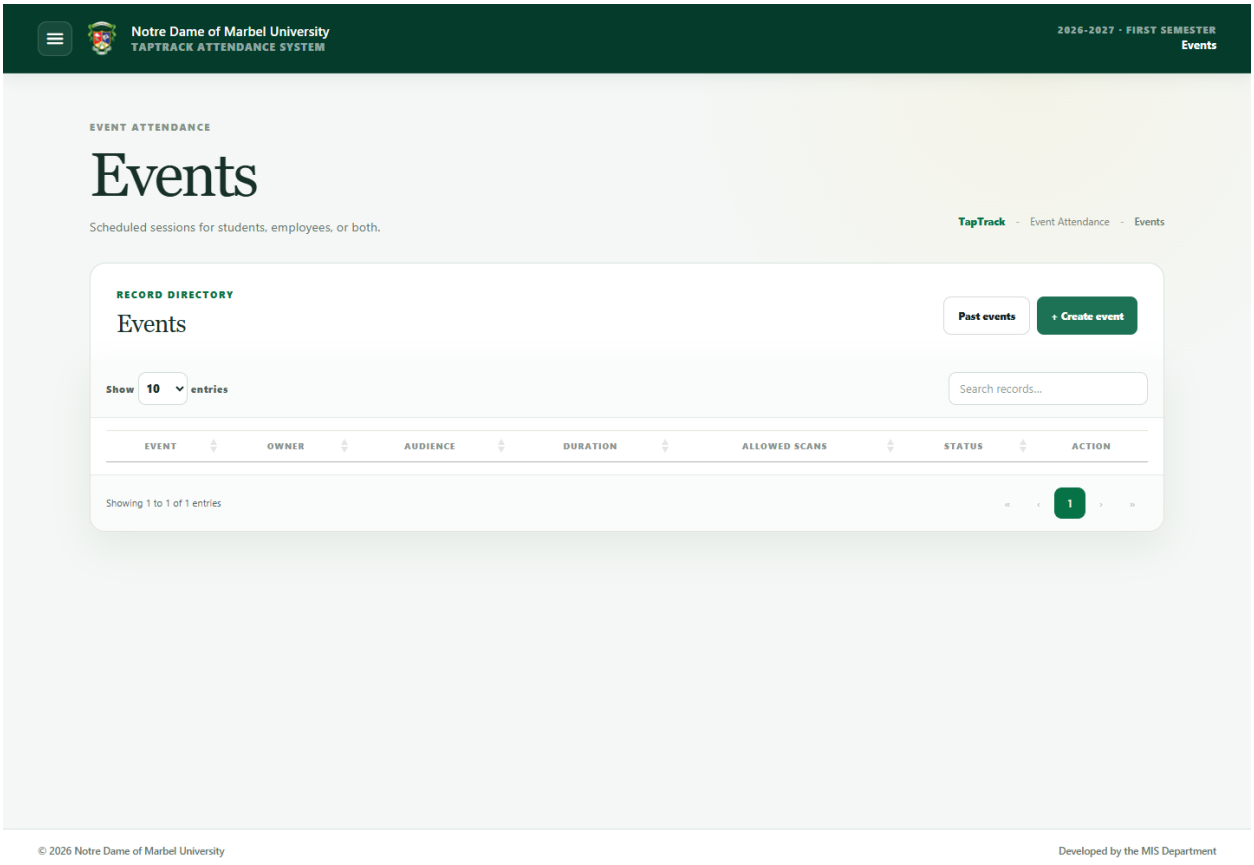

Figure 4. Event management

Important behavior:

• Event access follows the user's assigned permissions and visible-people scope.

• Event owners can see current and historical events associated with their account.

• Superadmins and Administrators can see all events.

• Students, employees, or both may be accepted according to the event configuration.

Use the action for an event to open its scanner, edit details, export attendance, or perform other available management tasks. On the scanning page, type/scan the ID and confirm that the person's identity and action are correct. The latest Time In or Time Out display clears after 30 seconds and is not restored when the page reloads.

4.2 Correct an event scan

When permitted, open the event attendance records and choose the affected record. Update the action/time or delete the incorrect scan. Enter the required reason. TapTrack retains correction details for audit purposes.

4.3 View past events

Open Events → Past events, select the academic period, and use search/filter controls to find an event. Export attendance or corrections when needed.

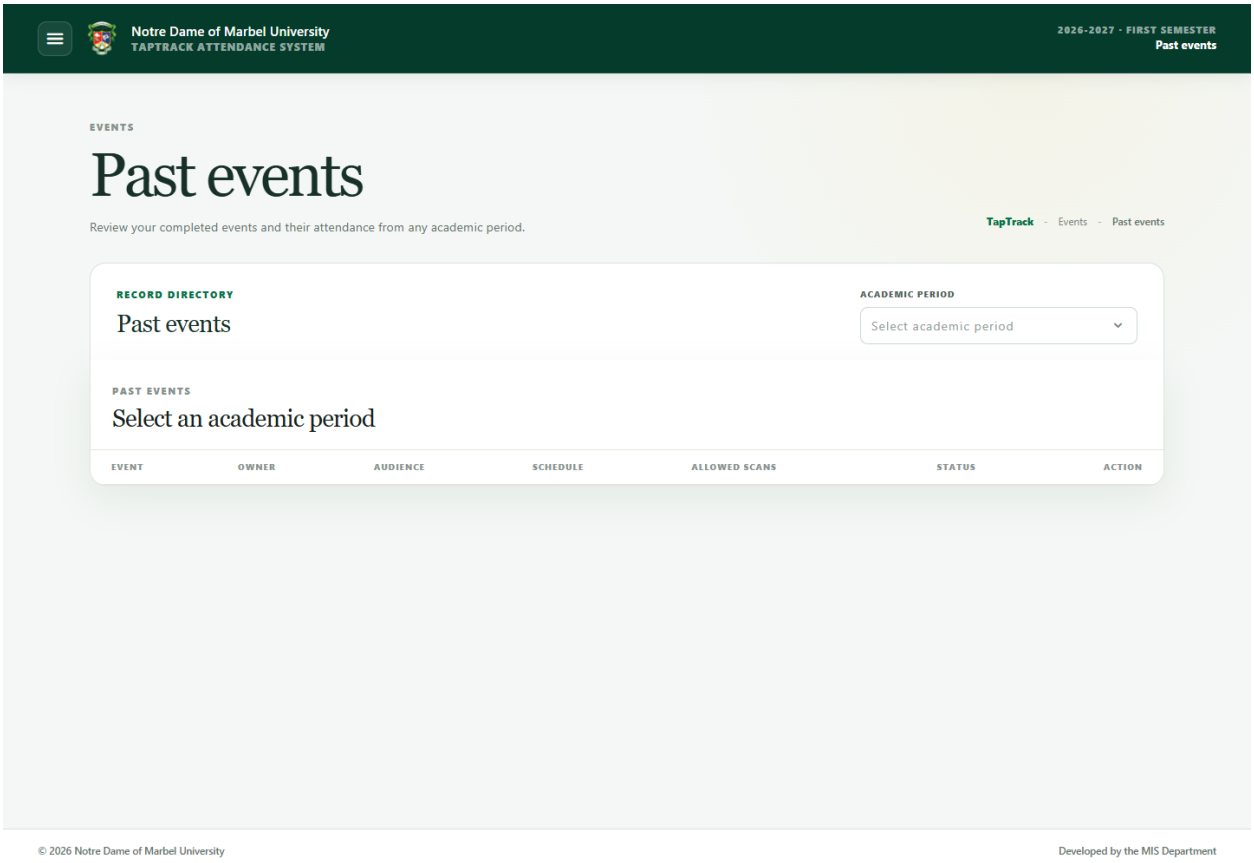

Figure 5. Past events

5. Library and Internet Section

Open the corresponding page from the Library menu. Both pages show the person's ID, name, type, current/previous scan information, and scan time as available.

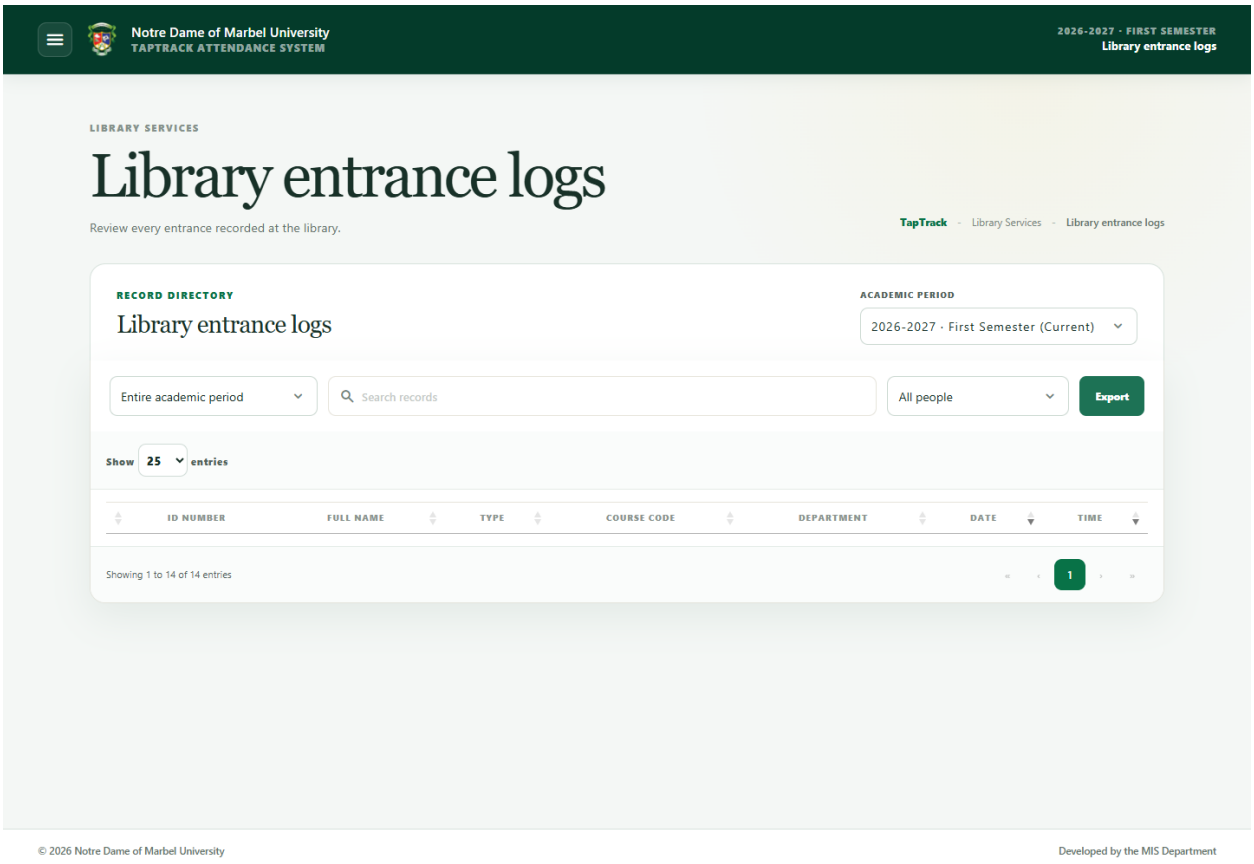

Figure 6. Library entrance logs

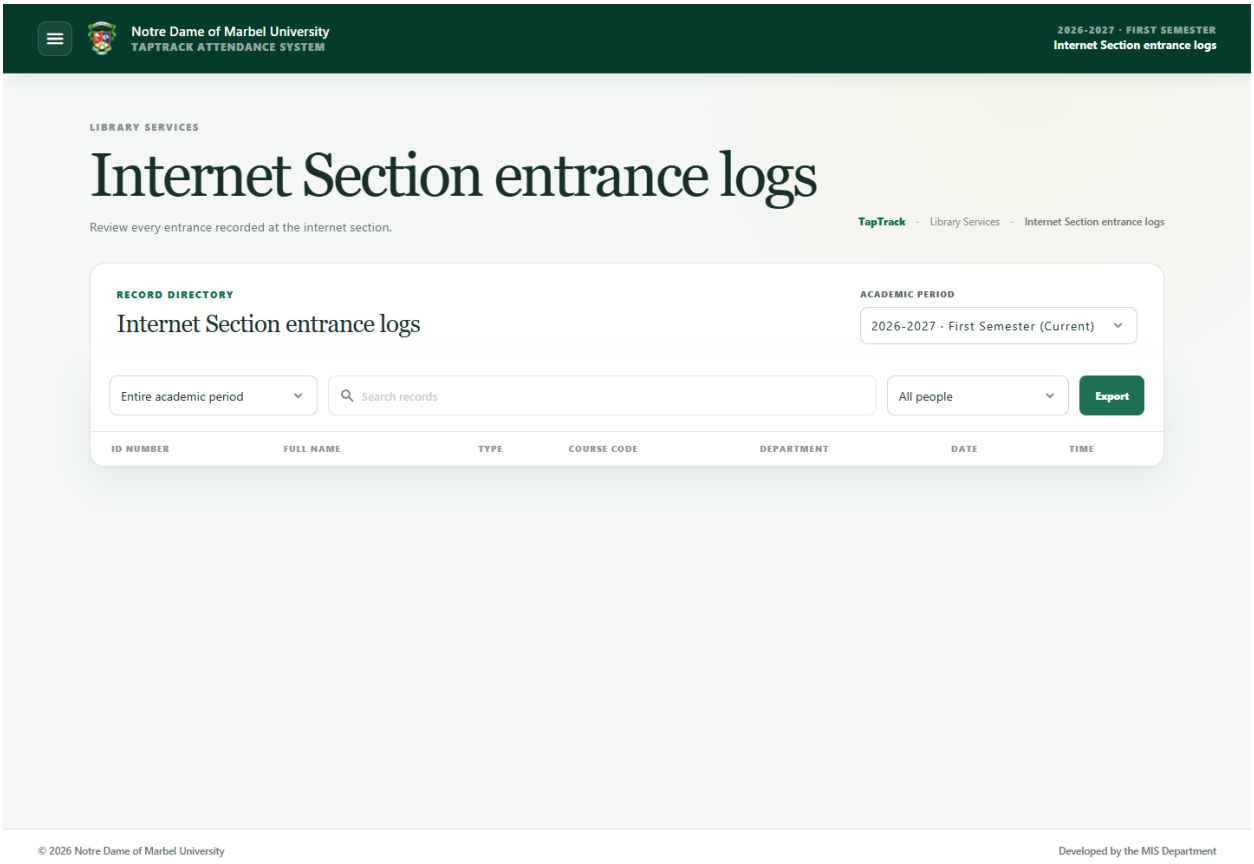

Figure 7. Internet Section logs

Search or sort the table to find a record. Use the individual export action when a person's attendance is required, and select the academic period in the export dialog.

6. Student directory

Open Maintenance → Students. Student names are displayed as Last name, First name Middle name and are sorted by name. The ID number is the first table column.

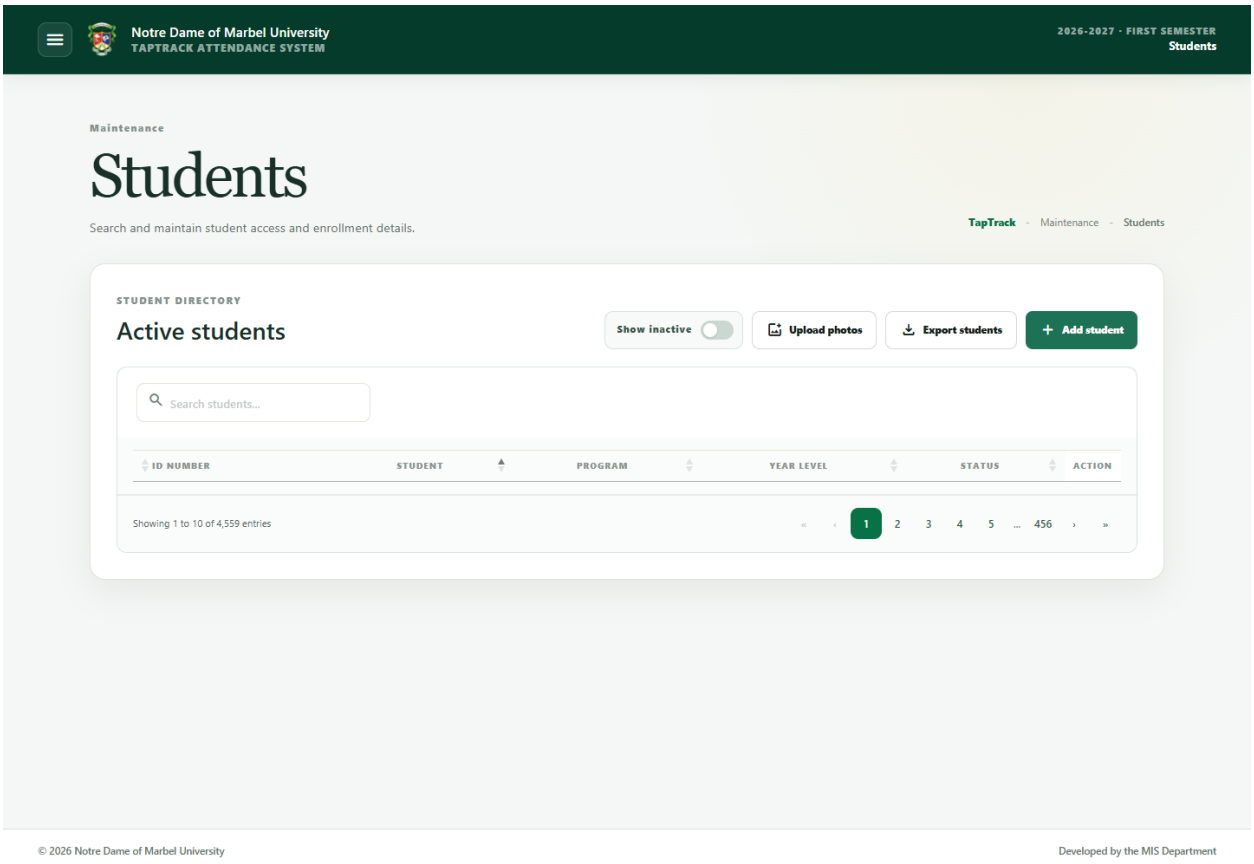

Figure 8. Student directory

Add one student

1. Select Add student.
2. Enter the required identity and academic information.
3. Optionally choose a JPEG, PNG, or WebP profile photo.
4. Confirm whether the record should be active.
5. Select Save.

The photo is uploaded only when the student record is saved. The activity log identifies the new student.

Edit, deactivate, or reactivate

Open Manage on the row and choose the required action. Saving an edited record also uploads a newly selected photo. Deactivation requires confirmation in a modal. Turn on Show inactive to find inactive records and reactivate them when authorized.

If an inactive student scans an ID, TapTrack instructs the student to visit the MIS Office for account reactivation.

Bulk import

Use the import action and the current template. Match the required columns and review the summary before completing the import. A re-uploaded matching inactive student becomes active again. Bulk activity is recorded as one log entry showing how many rows were added.

Import enrolled students from SQL Server

Only a Superadmin or Administrator can see and use Import SQL Server.

1. Open Add student, then select the SQL Server import option.

2. Enter the school year in YYYY-YYYY format and choose the full semester name, such as First Semester.

3. Select Preview import. A processing message remains visible while TapTrack reads and validates the registrar view.

4. Review New students, Updates, and Invalid rows separately. Each group displays its own records; use its load-more control to view the next batch.

5. Correct invalid registrar data before importing. Supported gender values are Male and Female.

6. Review how many currently active students are absent from the selected enrollment source.

7. Leave Confirm deactivation off to import without deactivating anyone. Turn it on only when the missing students must be made inactive.

8. Select Import students.

The activity log records the school year, full semester name, number added, number updated, and number deactivated. The registrar connection uses the configured read-only view documented in docs/mssql-student-import-view.sql.

Bulk photo upload

Select Upload photos and choose supported image files. Name every file with the matching student ID number so TapTrack can associate it with the correct record. There is no overall photo-count limit: TapTrack queues the selection in manageable batches and displays progress until every photo has been processed. Each individual JPEG, PNG, or WebP file must be 2 MB or smaller.

7. Alumni directory

Open Maintenance → Alumni to manage former students independently from the active student directory. Alumni remain eligible for normal university, library, and Internet Section scanning and are identified as Alumnus; there is no separate alumni scanner.

Add or import alumni

• Select Add alumnus to enter one record manually.

• Use the import option inside Add alumnus to import an ID-based alumni file.

• A matching active student is copied to the alumni directory and then deactivated as a student.

• Importing or transferring a student does not delete the original student record or its attendance history.

• Verify the program and graduation year before saving or importing.

Move graduating students to alumni

Use Move to Alumni on one student, or Bulk move to Alumni for a graduating group. Review the selected records and graduation information before confirming. TapTrack copies each student to the alumni table and deactivates the student account in one controlled operation.

Re-enroll an alumnus

If an alumnus enrolls in graduate school, law school, or another bachelor′s program, choose the re-enrollment action and select the new program and year level. TapTrack retains the alumni record and graduation history, reactivates the linked student account, and updates the student′s current program.

8. Employee directory

Open Maintenance → Employees. Employee IDs appear first; names use Last name, First name Middle name and are sorted by name.

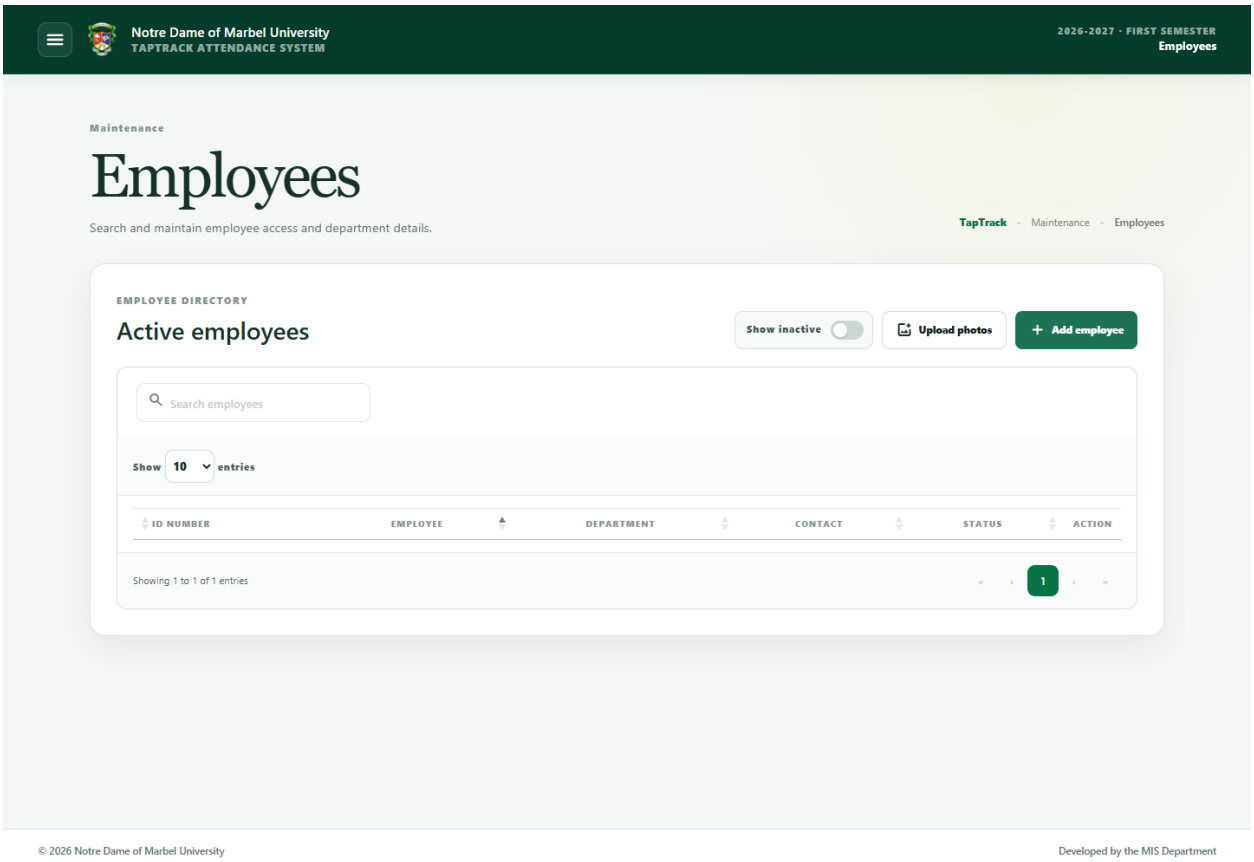

Figure 9. Employee directory

Adding, editing, deactivating, reactivating, importing, and uploading photos follow the same process as the student directory. Employees use the separate Employee departments directory; no employee role field is required. A re-uploaded matching inactive employee becomes active again.

If an inactive employee scans an ID, TapTrack directs the employee to MIS for reactivation.

Bulk employee photo selections are also queued automatically with no overall photo-count limit.

9. NFC card enrollment

From a student or employee row, choose the NFC enrollment action. Card enrollment is available to Superadmin and Administrator accounts.

1. Connect the supported NFC writer to the computer performing enrollment.
2. Ensure the Smart Card service and the local NFC bridge are running on that computer.
3. Place one authorized writable card on the writer.
4. Select Read card.
5. Select Write and verify card only after the correct person is displayed.

TapTrack writes only the exact ID number, then reads it back for verification. Do not remove the card during writing. The local bridge is required on every client PC that has an NFC writer; a central web server cannot directly access a USB writer attached to another PC.

10. Academic maintenance

Create parent records before child records. Avoid deleting or deactivating records that are still referenced by people or attendance data.

Schools

Schools are the top level of the academic hierarchy. Use Add school, or select the edit icon on an existing row. Use Show inactive to include inactive records.

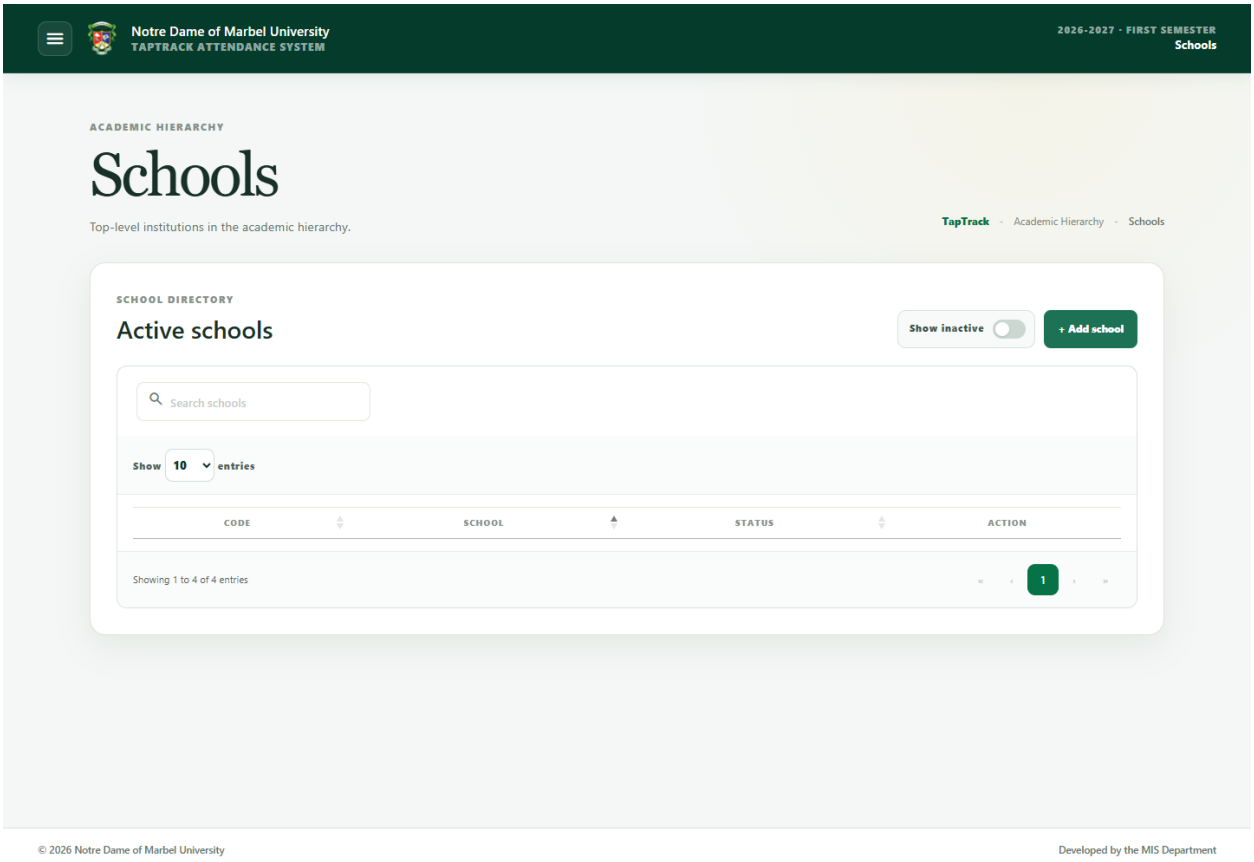

Figure 10. Schools

Colleges

Create colleges under their parent school. Codes should be short, unique, and consistent with import files.

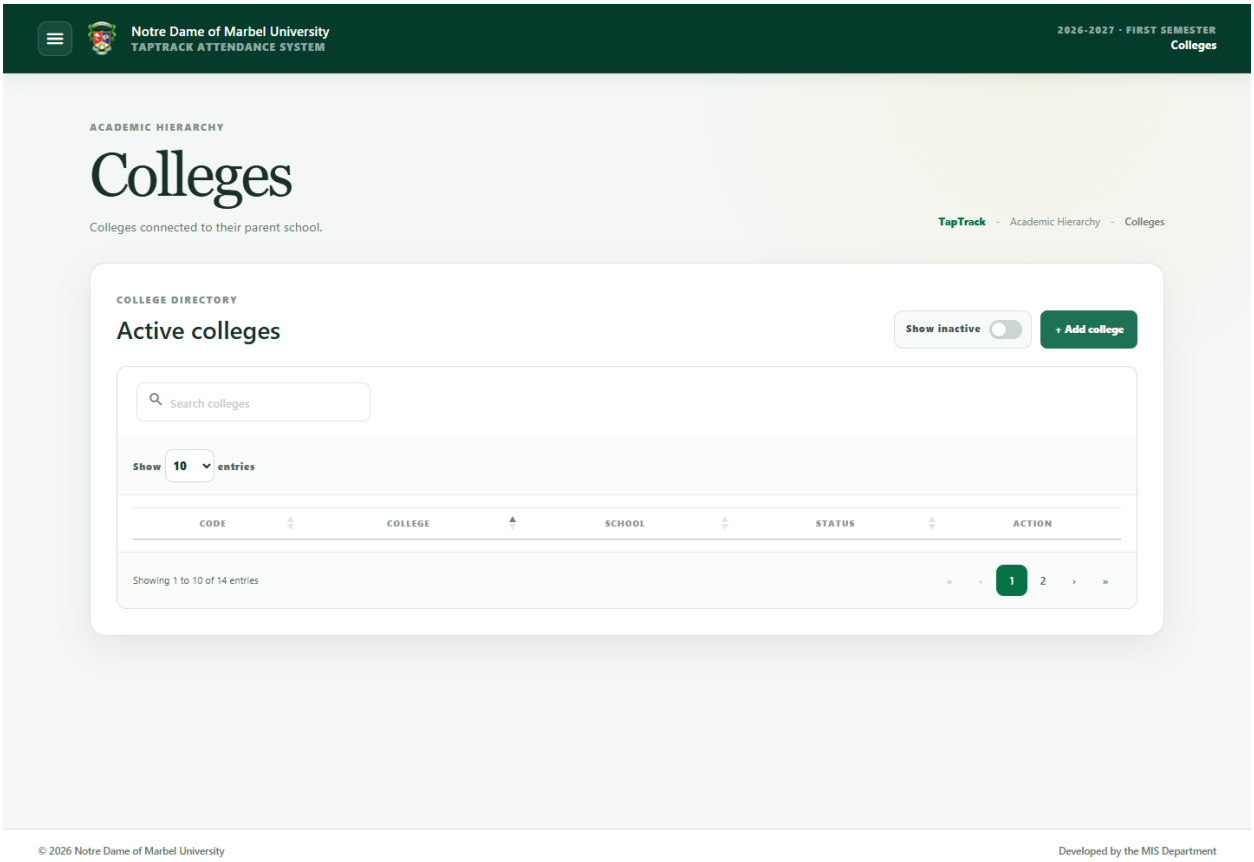

Figure 11. Colleges

Student departments

Departments used by student programs belong to the academic hierarchy.

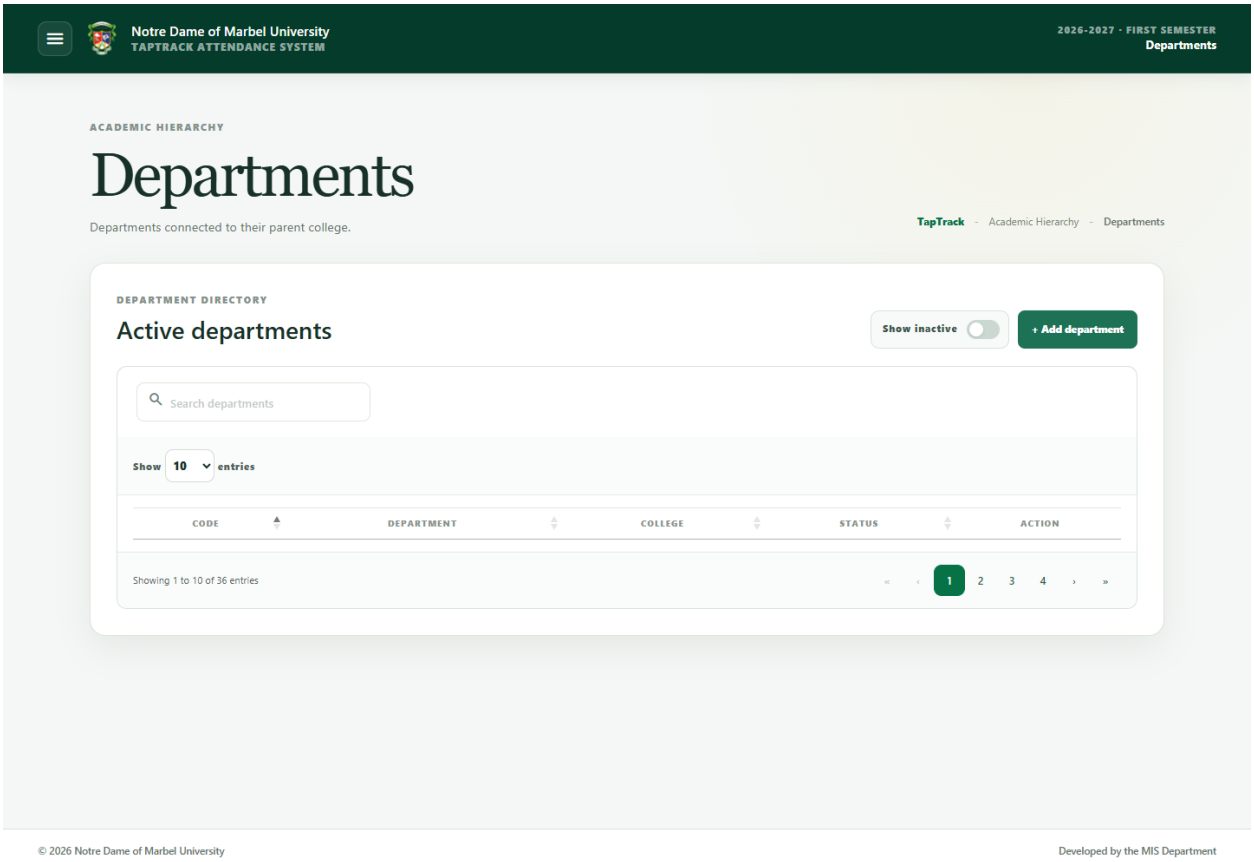

Figure 12. Student departments

Employee departments

Employee departments are maintained separately and are selected directly on employee records.

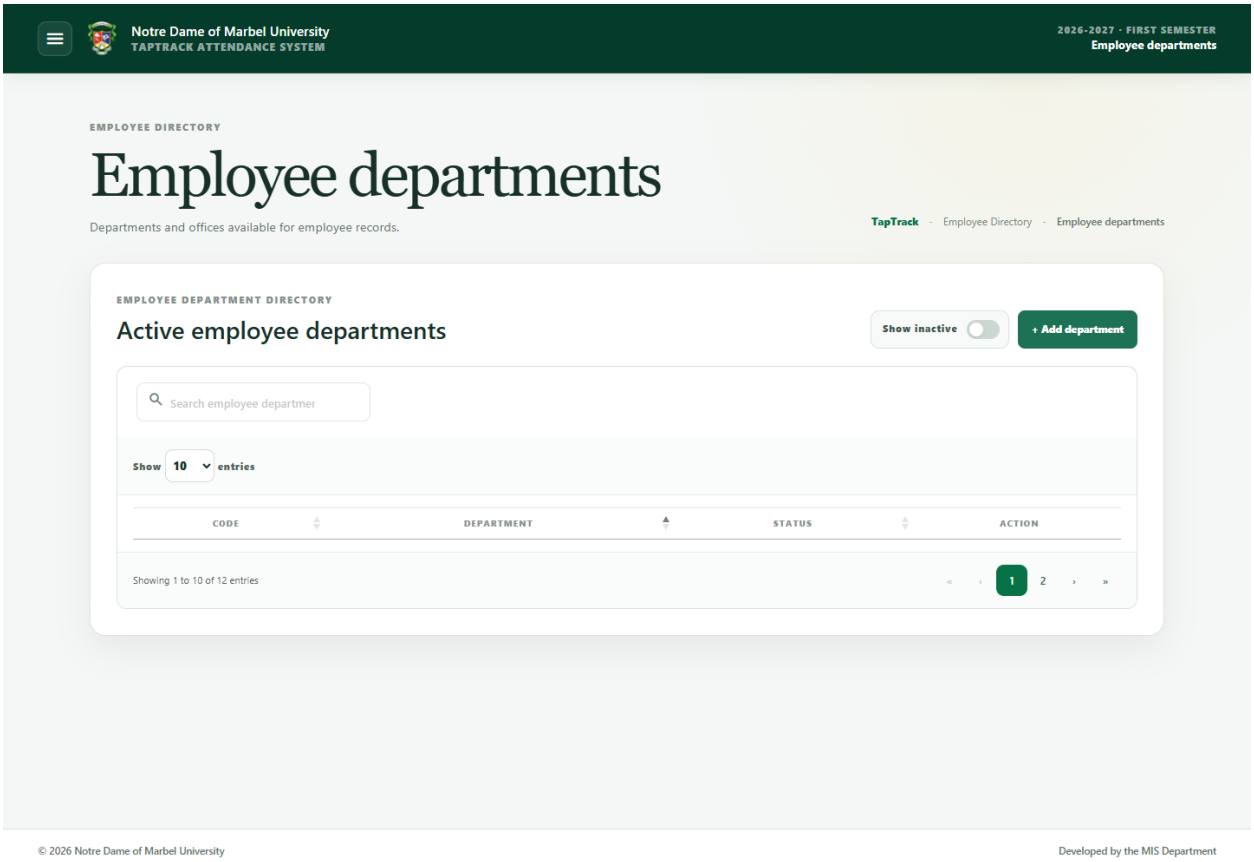

Figure 13. Employee departments

Programs

Create each program under the correct parent department. Program codes are used in student imports and exports.

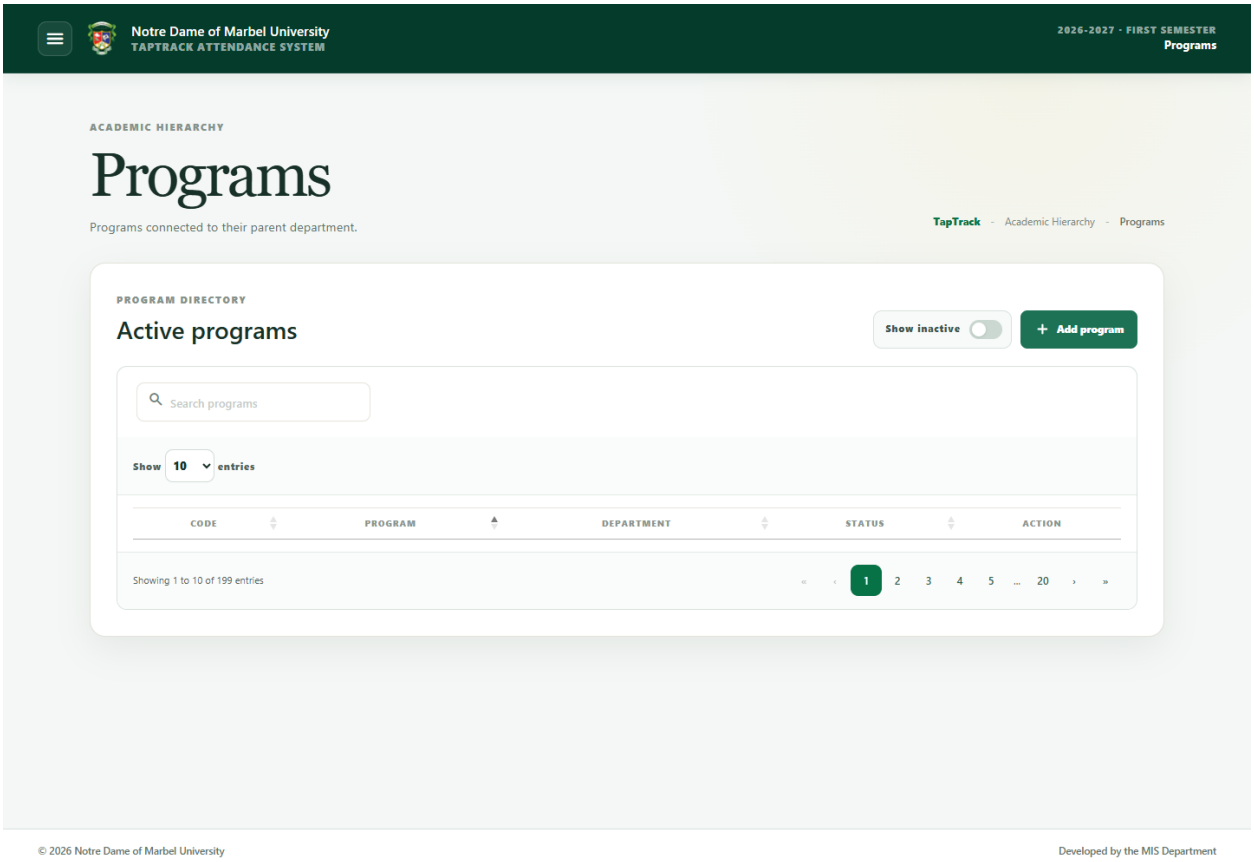

Figure 14. Programs

Academic periods

Academic periods determine where current records are stored and which historical records can be loaded.

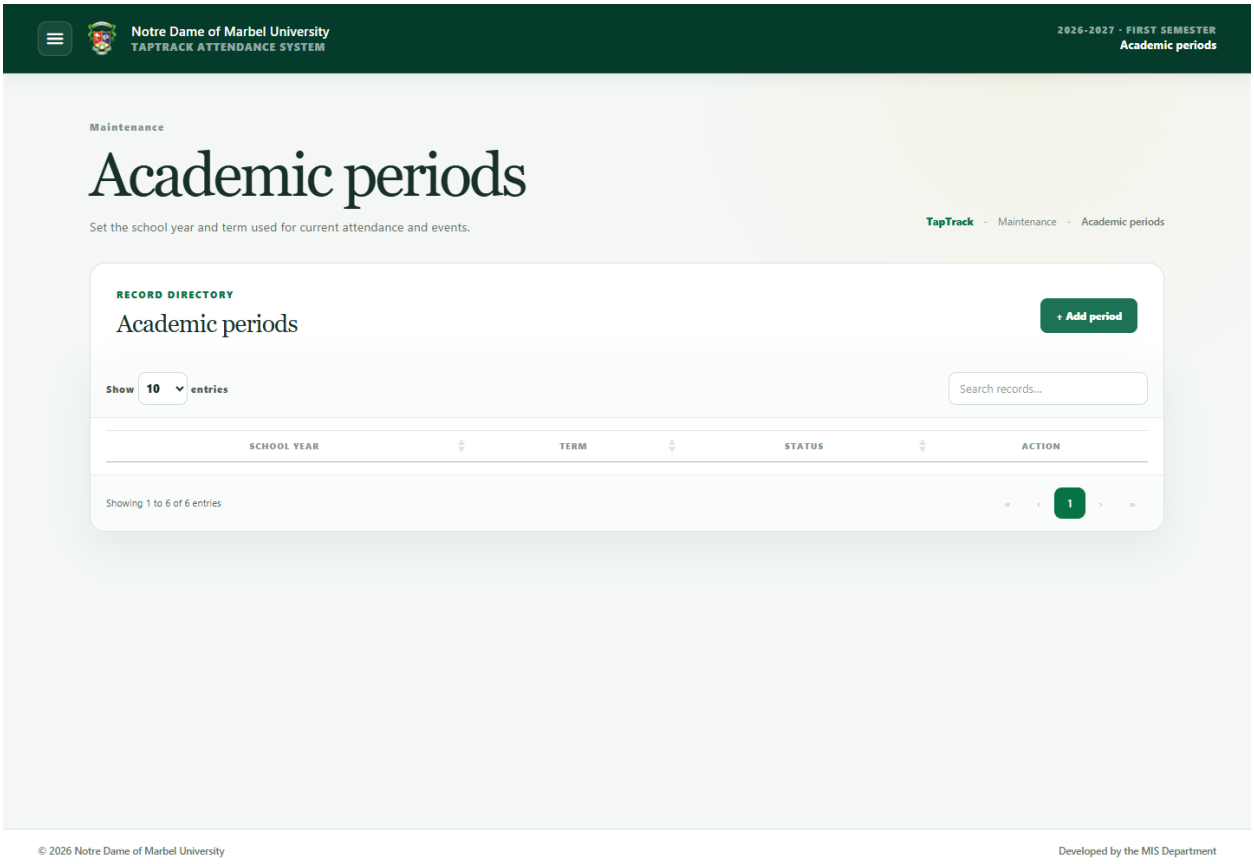

Figure 15. Academic periods

Available terms include First Semester, Second Semester, Summer, First Term, Second Term, and Third Term. Only the period intended for current operations should be marked Current active period. Verify the school year and term carefully before activating it.

11. System settings

Open Maintenance → System settings to configure system-wide options presented by the page.

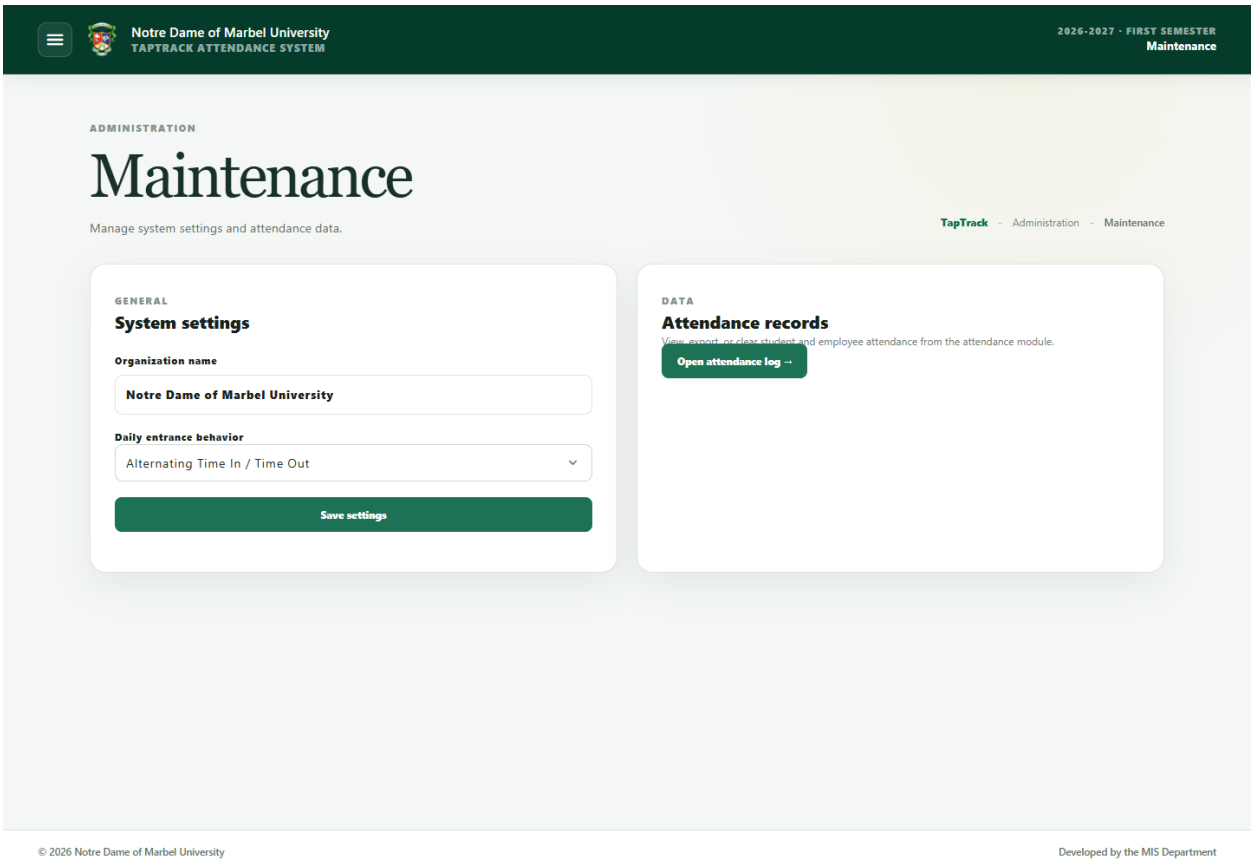

Figure 16. System settings

Changes affect all users or kiosks. Record the reason for operational changes and test scanners after modifying scanner-related settings.

12. Users and access

Activity log

Open Users & access → Activity log to review sign-ins and administrative activity. Search or filter to investigate an account or operation.

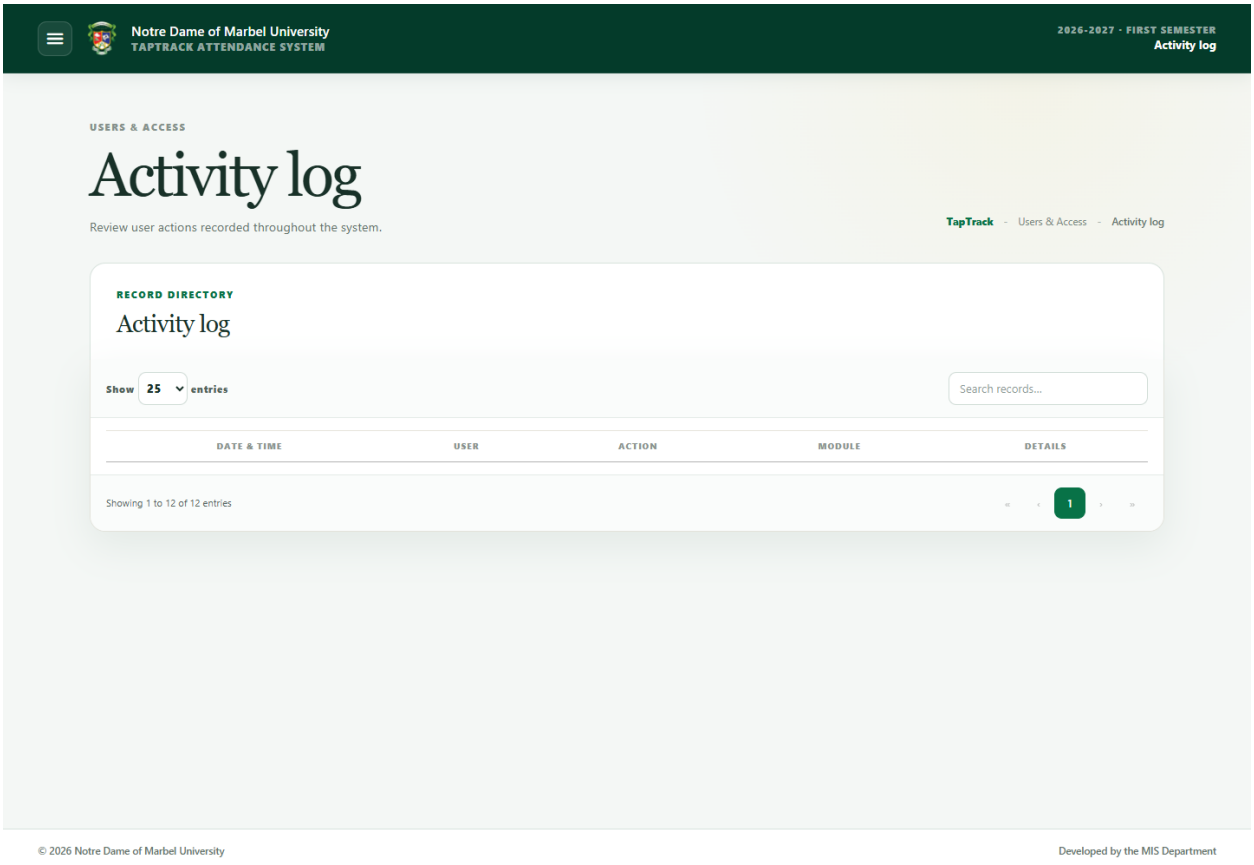

Figure 17. Activity log

Permissions

Permissions define which modules a role can access and whether its directory scope includes students, employees, or both.

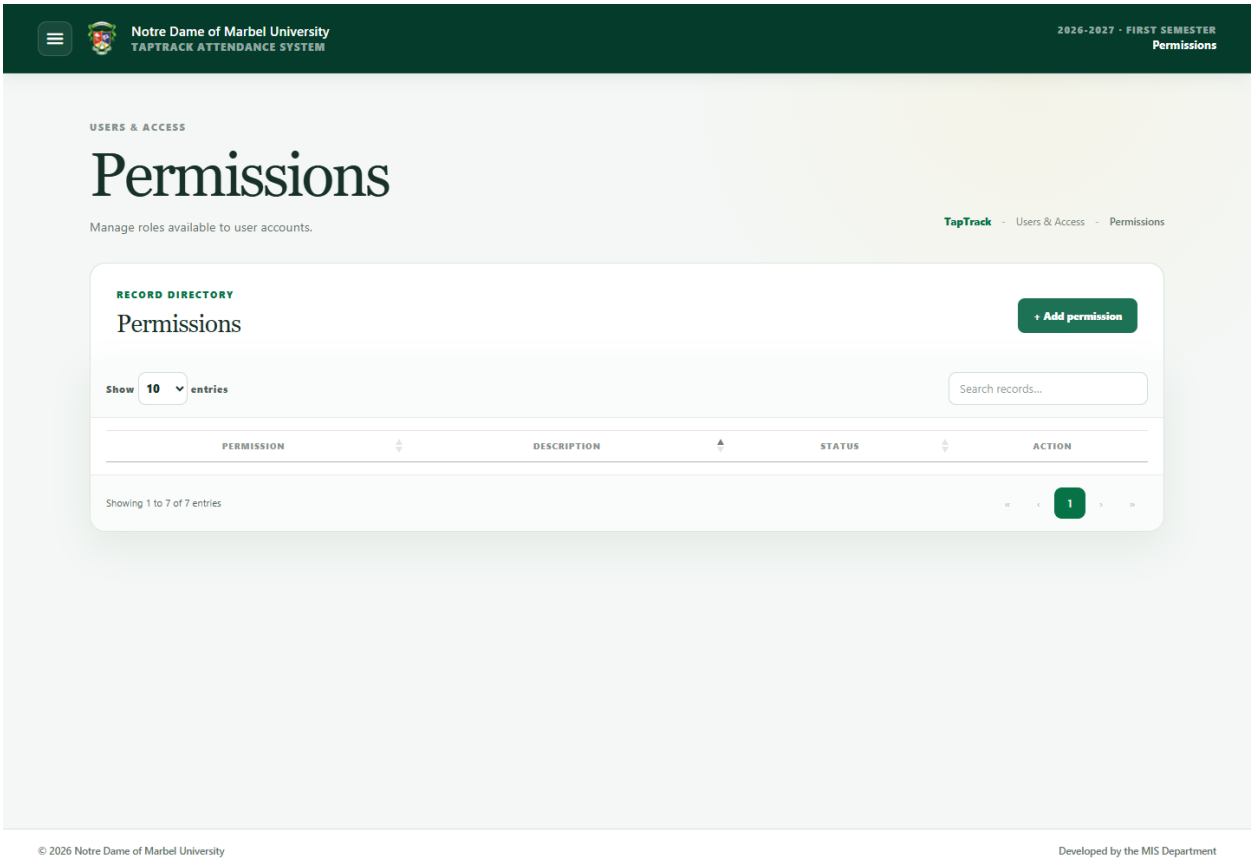

Figure 18. Permissions

To add a permission:

1. Select Add permission.

2. Enter a clear description/name.

3. Enable only the required modules: Overview, Attendance, Events, Historical data, Library, Maintenance, and/or User & access.

4. Select the visible-people scope.

5. Leave Active permission on when the role may be assigned.

6. Save.

Use least privilege: do not grant Maintenance or User & access unless the person's work requires it.

User management

Open Users & access → User management to create or update staff accounts.

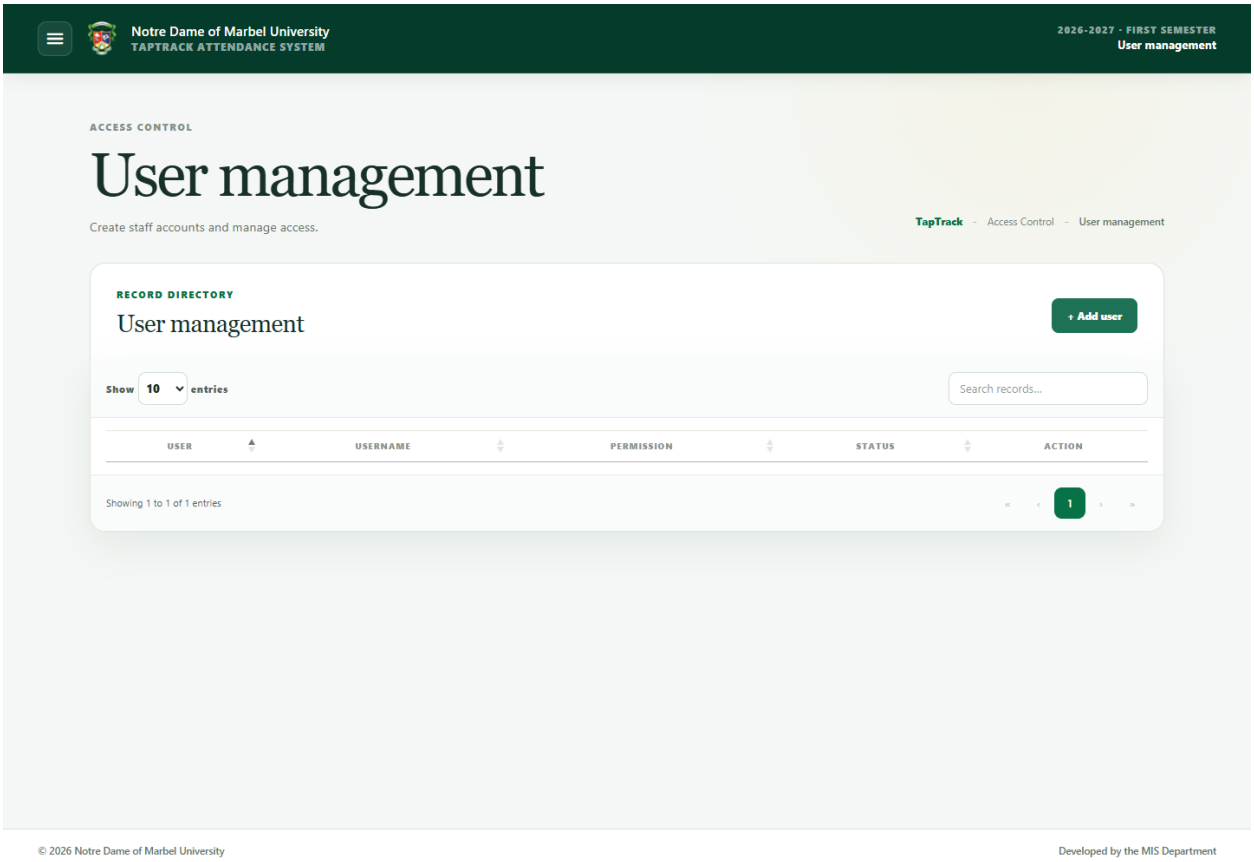

Figure 19. User management

When adding a user, enter the name, unique username, optional institutional email where applicable, initial password, permission, and active status. Deactivate accounts that should no longer sign in. Do not reuse a shared Superadmin account for routine work.

13. Change password and sign out

Select Password in the navigation footer. Enter the current password, a new password of at least eight characters, and confirmation, then save.

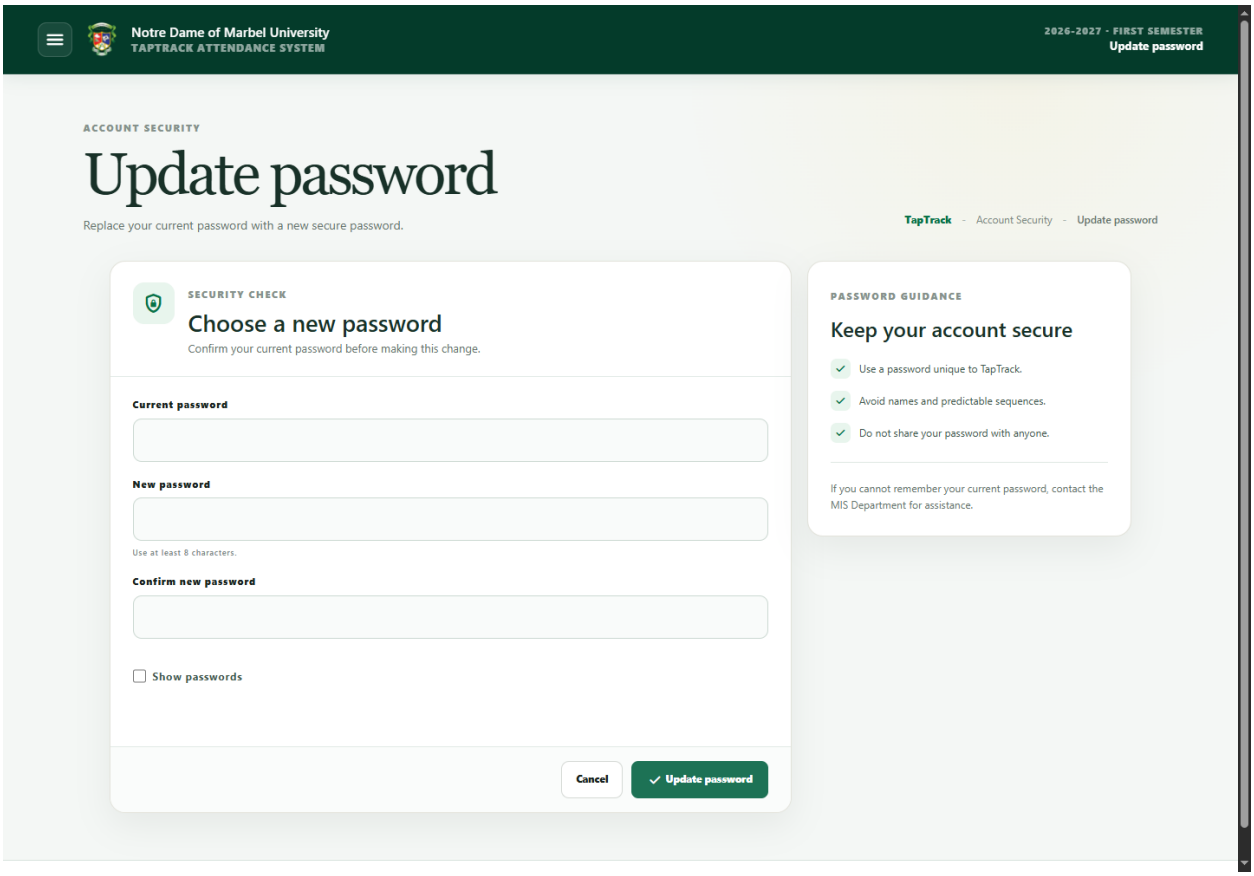

Figure 20. Change password

Select Sign out when finished, especially on shared terminals.

14. Kiosks and scanners

Public kiosk paths are provided by MIS for university entrance, library, and Internet Section scanning. Authorized input methods include typed IDs, keyboard-wedge RFID/barcode readers, and supported camera scanning.

Verify a new kiosk

The first time a kiosk is opened, TapTrack blocks scanning and asks for a Superadmin username and password. Successful verification enrolls that browser without exposing or storing the password. The secure kiosk cookie renews automatically for another 30 days whenever the kiosk is used, so routine visits do not ask for the password again.

Clearing the browser cookies or its kiosk device identity requires verification again. Failed verification attempts are rate-limited and written to the activity log. Never allow an unverified terminal to be used for attendance.

Manage kiosks centrally

Open Maintenance → Kiosks to review registered devices and their recent status. A Superadmin or Administrator can enable or disable a kiosk and send the supported browser or computer actions. Disabling a kiosk immediately revokes its session and rejects subsequent scans. Re-enabling it requires a new Superadmin verification.

• Manual keyboard input remains available even when no scanner is assigned.

• A camera requires a secure browser context. Use the HTTPS university URL approved by MIS; normal browsers block camera access on a LAN HTTP URL.

• A paired two-scanner university kiosk can distinguish Time In and Time Out devices through the scanner helper.

• Enter a clear terminal location in the scanner modal. Every scan records that location.

• Pairing/assignment input must not be treated as attendance.

• Rapid duplicate scans at the Library or Internet Section are rejected while the first scan is being processed.

15. Troubleshooting

Problem	What to do
Invalid username/password	Check spelling and Caps Lock. Ask MIS to verify the active account; do not repeatedly guess.
Inactive student/employee	Refer the person to MIS and reactivate only after authorization.
Camera is unavailable	Open the approved HTTPS URL, allow camera permission, close other apps using the camera, and reload.
NFC writer is unavailable	Connect the writer, start Windows Smart Card service, start npm run nfc-bridge on that client PC, and retry.
Scanner types but does not submit	Configure the keyboard-wedge scanner to append Enter after the ID.
Wrong scan action/location	Confirm the assigned device direction and terminal location before scanning.
Kiosk asks for verification	Have a Superadmin verify the device. If it was disabled, re-enable it in Kiosk management first.
Kiosk scan is rejected	Confirm that verification succeeded and that the kiosk is enabled. Unverified kiosks cannot submit scans.
SQL Server preview takes time	Keep the dialog open and wait for the processing message to finish. Do not repeatedly start another preview.
Invalid SQL Server row	Correct the registrar view value shown under Invalid rows, then preview again.
Some photo filenames are unmatched	Rename each file to the exact student or employee ID number, then upload those files again.
A table is slow	Narrow the search/filter and select a suitable page size. Report persistent delays to MIS.
Page/API error after deployment	Confirm that the latest database.sql was applied, restart TapTrack, and give the server error to MIS.

16. Data protection and backup

• TapTrack is for internal university-network use.

• Export only the records needed for an authorized purpose.

• Store exported workbooks securely and delete temporary copies when no longer needed.

• Back up both the MySQL database and uploads/profile-photos.

• Do not edit database rows directly during normal operation; use the TapTrack interface so actions remain auditable.

• Use HTTPS in production. Staff sessions are stored in secure HttpOnly cookies and are invalidated when the user signs out.

• Apply database.sql during deployment; production runtime schema changes are disabled by default.
